

**1. Have you had any experience with Kali Linux before?**

Yes, I have been using kali linux for the past 4 years to practice cybersecurity. Although the debian based kde system is often preferred by people. I have my interest based on the GNOME system as it provides me with a minimal desktop environment and helps me focus on performing the tasks with relevant tools that are already present in the system.

The command line operations with terminal has always been fascinating.

**2. Have you ever worked within a virtual machine or in a virtual environment?**

I have worked with VMware when installing Ubuntu and other linux distros in my pc.

Although the dual booting process is effective to maintain the two operating systems, I have been using different distros such as debian and fedora with operating systems such as parrot os, ubuntu, linux mint etc. With each requirement, Virtual machines have helped me to use and experience different operating systems to find the required tools and learn the concepts of networking and cybersecurity.

**3. Are there any specific tools within Kali Linux that you are looking forward to exploring?**

I always wanted to learn more about metasploit. The functionalities it offers has a diverse range of operations. I also want to learn more tools such as nikto, john the ripper, Ettercap. I have experience in the tools but, want to learn more in-depth operations. Tools such as burpsite, wireshark have always been interesting to use. Maltego has been one of my favorite tools and I'm really looking forward to explore it more.
